Introduction: Conventional 3D Object Design and Printing

► FDM-type 3D printers

- There are many types of 3D printers, but a popular cheap one is called fused deposition modeling (FDM) type.
- FDM-type printers extrude melted plastic from the nozzle and solidify it.

Rostock MAX

Introduction: Conventional 3D Object Design and Printing (cont'd)

▶ Outline of process for 3D object design and printing

- Step 1: Design by a 3D CAD tool and generation of (conversion to) a STL file
 - STL means Standard Triangulation Language or Stereo-Lithography.
- Step 2: Decomposition into layers by using a slicer (software)
- Step 3: Printing layer by layer by a 3D printer

▶ This process is explained in detail below.

[Step 1] Design by 3D CAD tools and output as STL files

- ▶ Conventionally designed by 3D CAD and expressed in a declarative language for describing 3D models.

Autodesk
(CAD software)

- ▶ 3D models converted to STL, a standard declarative language.

- STL expresses the surface shape of objects by a collection of triangles.

```
solid tippetop_1piece_v05-repaired
facet normal -0.988014 0.103855 -0.114202
  outer loop
    vertex -16.500000 0.000000 -7.935401
    vertex -16.139400 3.430540 -7.935400
    vertex -15.786800 3.355581 -11.054070
  endloop
endfacet
facet normal -0.988010 0.103854 0.114240
  outer loop
    vertex -16.500000 0.000000 -7.935401
    vertex -16.139400 0.000000 -4.816731
    vertex -16.139400 3.430540 -7.935400
  endloop
endfacet
...
endsolid tippetop_1piece_v05-repaired
```

[Step 2] Slices and G-Code

▶ **Sliced objects are usually represented by a procedural language for CAM, which is called G-Code.**

- G-Code is originally designed for programming the behavior of machine tools (bites etc.).
- G-Code specifies the motion of a print head, the velocity of extruding plastic, and so on.

▶ **Command examples**

- G0: simple tool motion
 - G0 X0 Y0 Z0 F3600: move to coordinate (0, 0, 0) at 3600 mm/min
- G1: tool motion with milling (printing)
 - G0 X0 Y0 Z0 F3600 E100: move with extruding filament specified by E100

[Step 3] Printing 3D Objects

- ▶ **A print head only move horizontally unless transiting to the next layer.**
 - Because it normally prints horizontally-sliced layers one by one.
- ▶ **By using G-Code, however, the head can move toward any direction.**

`G0 X1 Y1 Z1`
`(X0, Y0, Z0) → (X1, Y1, Z1)`

- Although many 3D printers are not good in vertical motion.

Turtle Graphics

► Seymour Papert and Logo

- Papert designed Logo programming language for children.
- By using Logo, 2D line art can be drawn by a “turtle” — (2D) turtle graphics

► Drawing commands for turtle graphics

- Forward d: move forward by d.
- Left a: turn left by a (degrees).
- Right a: turn right by a (degrees).

http://www.atarimagazines.com/compute/issue37/turtle_graphics.php

3D Turtle Graphics

► Basics

- forward, left, right
- up, down

► Extended 3D turtle graphics

- Bernd Paysan, “Dragon Graphics”

Paysan, B., ““Dragon Graphics” Forth, OpenGL and 3D-Turtle-Graphics”, 2009, <http://bigforth.sourceforge.net/dragongraphics-eng.pdf>

“Turtle Graphics” by 3D Printing

▶ Drawing commands are translated into G-Code

- Forward → G1 (moving while printing)

▶ Turtle coordinates are converted to Descartes coordinates

- The direction of turtle is memorized by the G-Code generating program.
- Forward → The next coordinates are calculated from the current coordinates and direction.
- Left, Right → The direction is updated.

▶ Selection of a turtle coordinate system

- Polar coordinates
 - Turtle direction is arbitrary in 3D.
 - Coordinates of flight simulators are polar.
 - Difficult to guarantee printability because difficult to know the gravity direction.
- Cylindrical coordinates
 - Turtle direction is fixed to be horizontal.
 - Vertical displacement is recorded.
 - Probably easier to be designed.

Difference between 3D Printing and 3D Graphics

▶ **It is difficult to print on the fly by 3D printing.**

- Lines can be drawn freely at any location in the 3D space by 3D graphics.
- While printing on earth, printing on the fly is difficult because extruded filament must be supported.

▶ **Printing velocity and amount of filament extrusion must be controlled (are controllable).**

- Thickness of lines can be controlled in 3D graphics.
- Specialized techniques, which are unnecessary in 3D graphics, are required for pretty 3D printing.
 - E.g., the printing velocity must be regulated.

Alternatives and Library Development

► Alternatives

- To design a language similar to Logo
- To develop libraries for conventional languages
 - this is easier and has more potential to be popular

► Selection: A library for Python, `turtle.py`, was developed.

- Cylindrical coordinates are used.
- Moving forward with moving up or down by `forward(r, z)`.
- Provided as open-source software: It is for Rostock MAX, so a slight modification is required for other printers.
- Example: helix

```
turtle.init(FilamentDiameter,  
           HeadTemperature, BedTemperature, defaultCrossSection,  
           x0, y0, 0.4);
```

```
dz = 0.4 / 72;  
for j in range(0, 16):  
    for i in range(0, 72):  
        forward(1, dz);  
        left(5);
```

Experiments: Method

▶ Following examples were tested.

- Cylinder (helix)
- Skewed square pyramid
- Flat fractal

3次元フラクタルは困難

▶ Repeated the following steps until succeeded.

- Program description
- Confirmation by graphics
- 3D printing

```
temp.py
#!/usr/bin/python
# -*- coding: utf-8 -*-

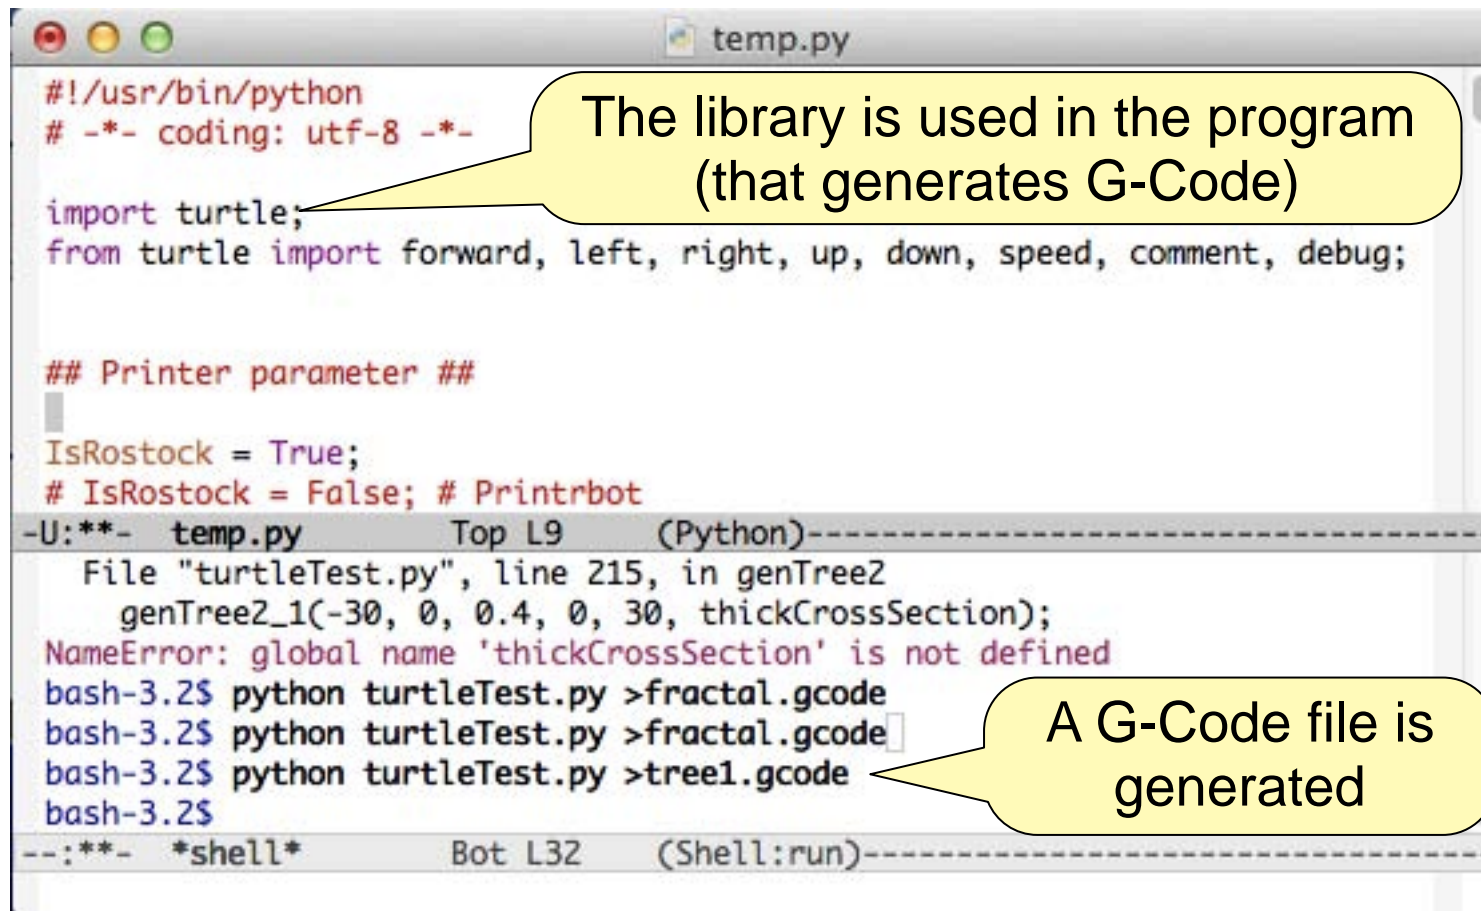

import turtle;
from turtle import forward, left, right, up, down, speed, comment, debug;

## Printer parameter ##
IsRostock = True;
# IsRostock = False; # Printbot
U:**- temp.py Top L9 (Python)-----
File "turtleTest.py", line 215, in genTree2
genTree2_1(-30, 0, 0.4, 0, 30, thickCrossSection);
NameError: global name 'thickCrossSection' is not defined
bash-3.2$ python turtleTest.py >fractal.gcode
bash-3.2$ python turtleTest.py >fractal.gcode
bash-3.2$ python turtleTest.py >tree1.gcode
bash-3.2$
--:**- *shell* Bot L32 (Shell:run)-----
```

Program Description

► Programming and debugging using editors / IDE

```
temp.py
#!/usr/bin/python
# -*- coding: utf-8 -*-

import turtle;
from turtle import forward, left, right, up, down, speed, comment, debug;

## Printer parameter ##
IsRostock = True;
# IsRostock = False; # Printrbot

-U:**- temp.py Top L9 (Python)-----
File "turtleTest.py", line 215, in genTree2
    genTree2_1(-30, 0, 0.4, 0, 30, thickCrossSection);
NameError: global name 'thickCrossSection' is not defined
bash-3.2$ python turtleTest.py >fractal.gcode
bash-3.2$ python turtleTest.py >fractal.gcode
bash-3.2$ python turtleTest.py >tree1.gcode
bash-3.2$
--:**- *shell* Bot L32 (Shell:run)-----
```

The library is used in the program (that generates G-Code)

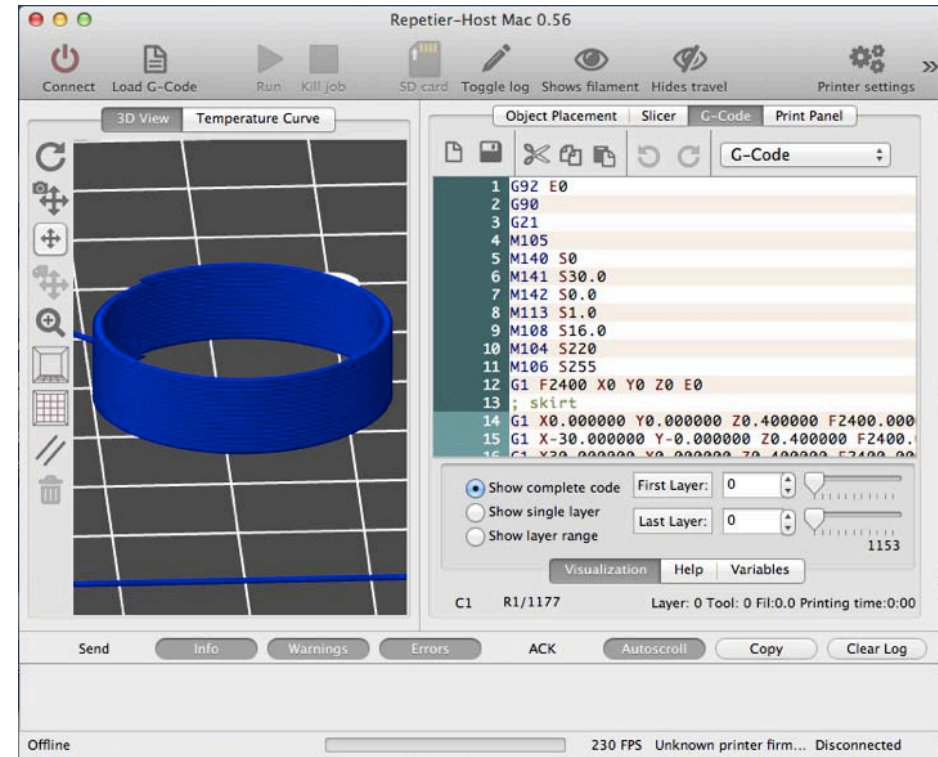

A G-Code file is generated

Confirming the Production by Graphics

► The G-Code file is graphically displayed by a 3D printing tool called Repetier-Host.

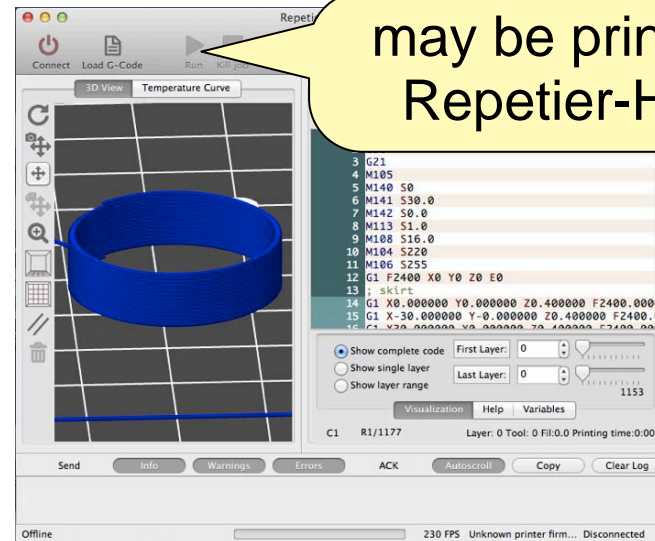

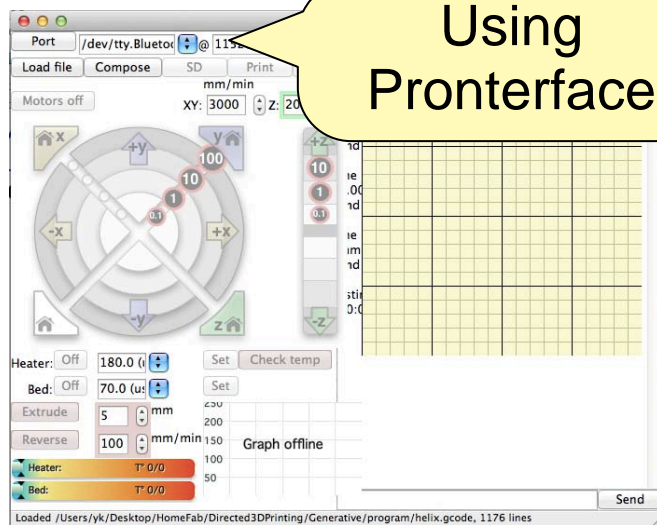

► Visually confirm whether it will be printed well.

- The tool checks only weak conditions (such as syntactic correctness of commands)
- Human beings may however misjudge the printability.
 - Because printing process is dynamic but graphics is static.

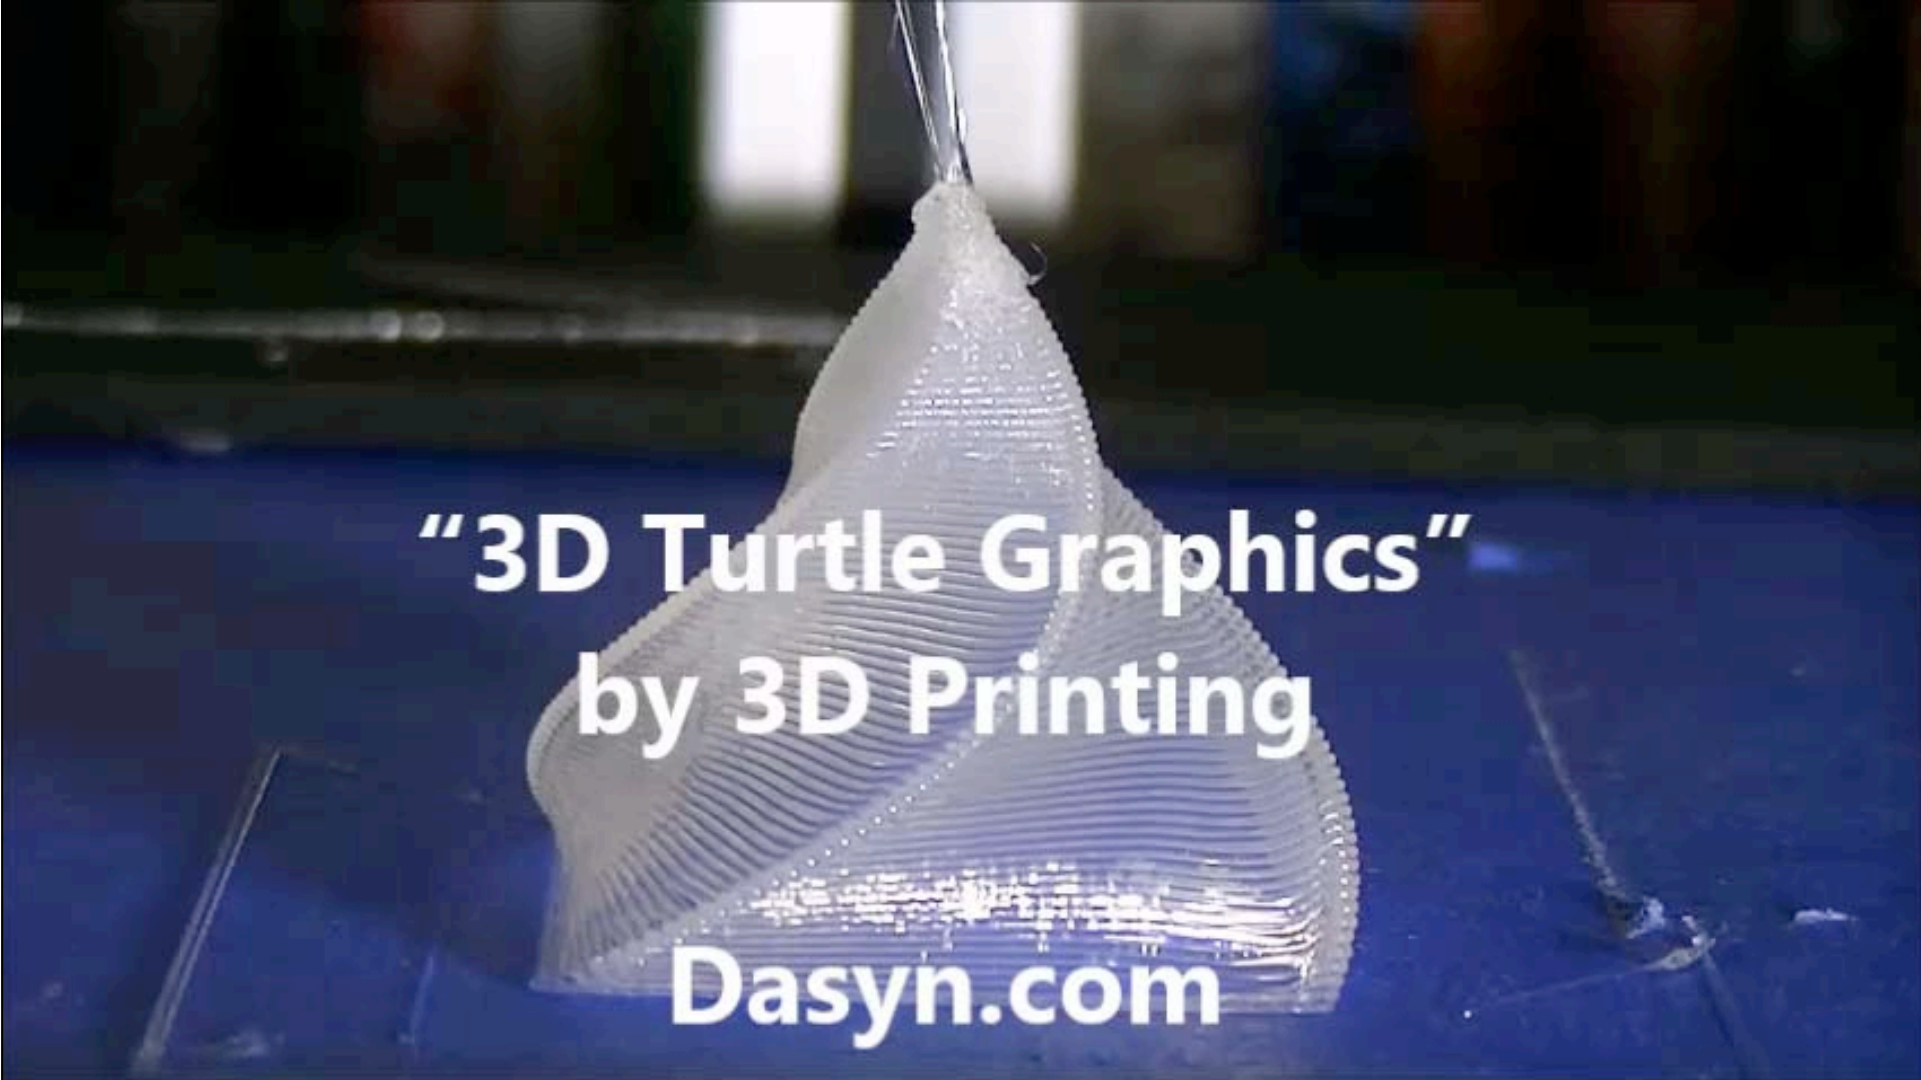

Printing Productions

- By using a 3D printing software, specify a G-Code file and print it.

Printing Process Example

A close-up photograph of a 3D printer's nozzle extruding a white filament to create a complex, lattice-like structure. The structure is a turtle shell, with the text "3D Turtle Graphics" and "by 3D Printing" overlaid on it. The printer is on a blue surface.

Bonus: Productions of Methods Other Than Turtle Graphics (cont'd)

► Direction- specified printing

► Shape generation by parts assembly and deformation

Conclusion

► Conclusion

- A Python library for 3D turtle graphics was developed.
- An environment for 3D turtle graphics can be built by combining this library and G-Code tools, 3D printers, and so on.

► Future work

- To try various shapes and support methods.
 - Devices with the current library.
 - Extensions of the library.
 - To try polar coordinates.
